PROJECT REPORT: SMART LIBRARY REQUEST WORKFLOW IN SERVICENOW

Date: April 7, 2026

Subject: ServiceNow Application Development & Workflow Automation

1.Abstract:

This project focuses on developing a **Smart Library Request Workflow** using the ServiceNow platform. Traditional library systems often rely on manual request handling, leading to delays and inefficiencies.

The proposed system automates the process of **book requests, approvals, and tracking**, ensuring faster service, transparency, and better resource management. By leveraging ServiceNow workflows, the system enhances user experience and reduces administrative workload.

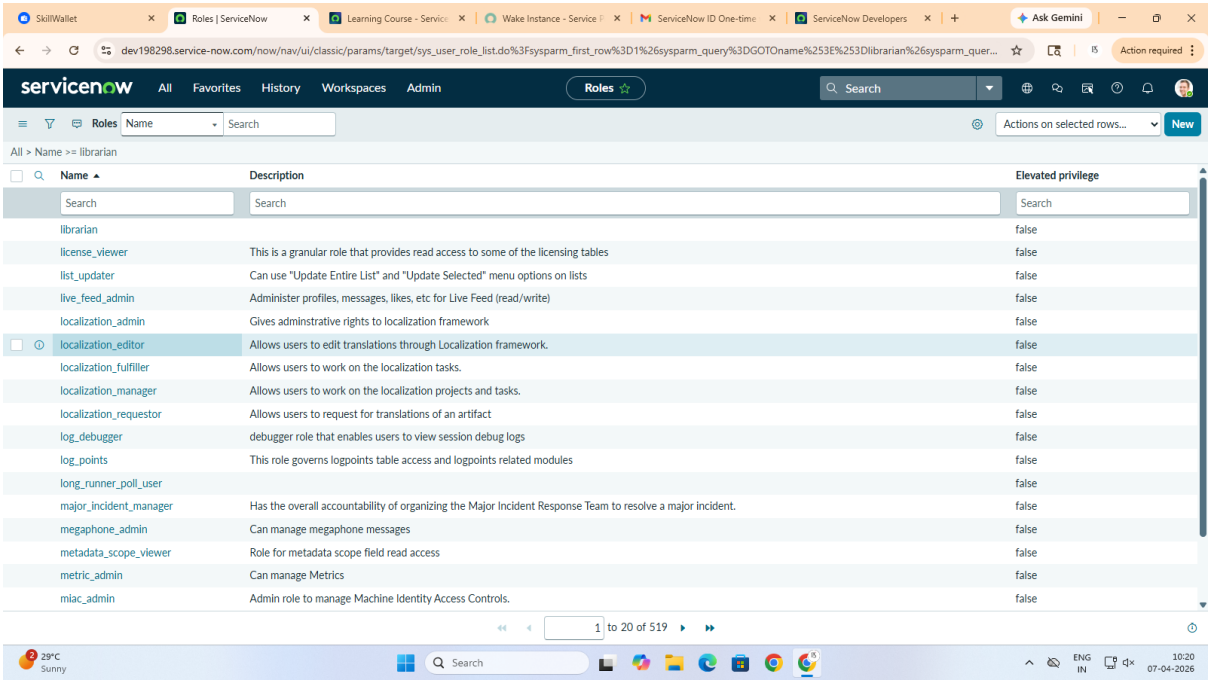
2. Introduction:

Library management plays a vital role in educational institutions. Manual request systems create issues such as delays, lost requests, and lack of tracking.

Problem Statement

- **Manual Requests:** Time-consuming and inefficient
- **Lack of Tracking:** Users cannot track request status
- **Delayed Approvals:** Librarian approval takes longer
- **No Centralized System:** Poor data management

Create book



Objectives

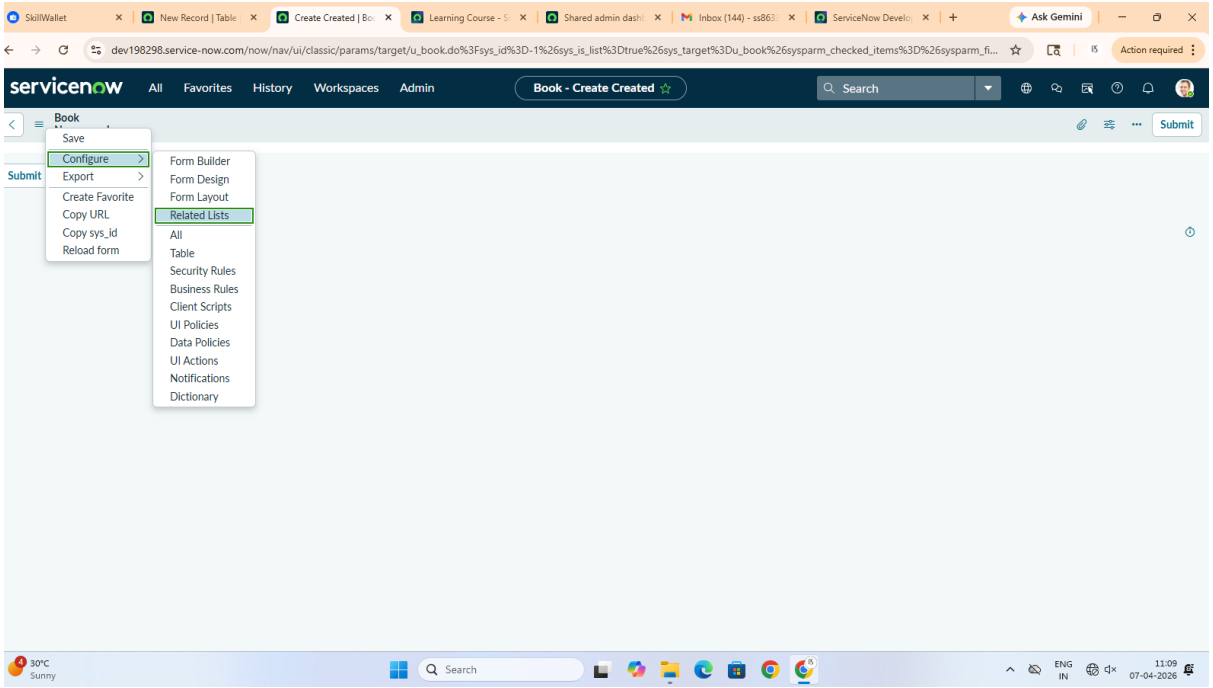
- Automate library book request process
- Provide real-time tracking of requests
- Implement approval workflow using ServiceNow
- Maintain centralized digital records
- Improve efficiency and user satisfaction

3. Literature Review:

Modern libraries are adopting digital and cloud-based systems for automation.

- **Existing Systems:** Library Management Software (LMS), ERP systems
- **Limitations:** Expensive, complex, and require training
- **Gap:** Lack of simple workflow-based request systems
- Project Goal: To develop a **cost-effective, workflow-based smart system** using ServiceNow that simplifies request handling.

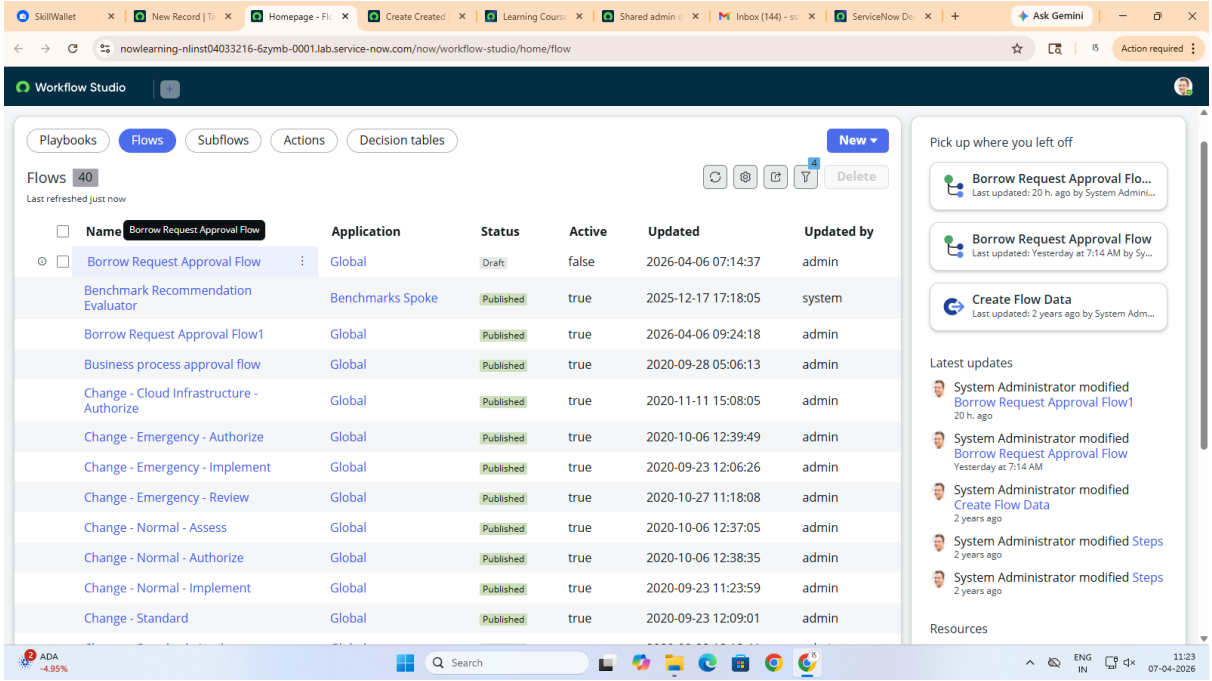
Data entry



4. Methodology:

Phase	Description
Requirement Analysis	Identify user needs (students, librarian)
System Design	Create tables, forms, and workflows
Development	Build ServiceNow catalog item and workflow
Testing	Verify request flow and approvals
Deployment	Make system available for users

Borrow Request Apporval Flow



Technical Stack

- Platform: ServiceNow
- Modules: Service Catalog, Flow Designer
- Database: ServiceNow Tables
- Features: Forms, Workflows, Notifications

5. Implementation

The system is divided into key modules:

1. Book Request Module

- Users submit request for books
- Form includes Book Name, Author, User Details

2. Approval Workflow

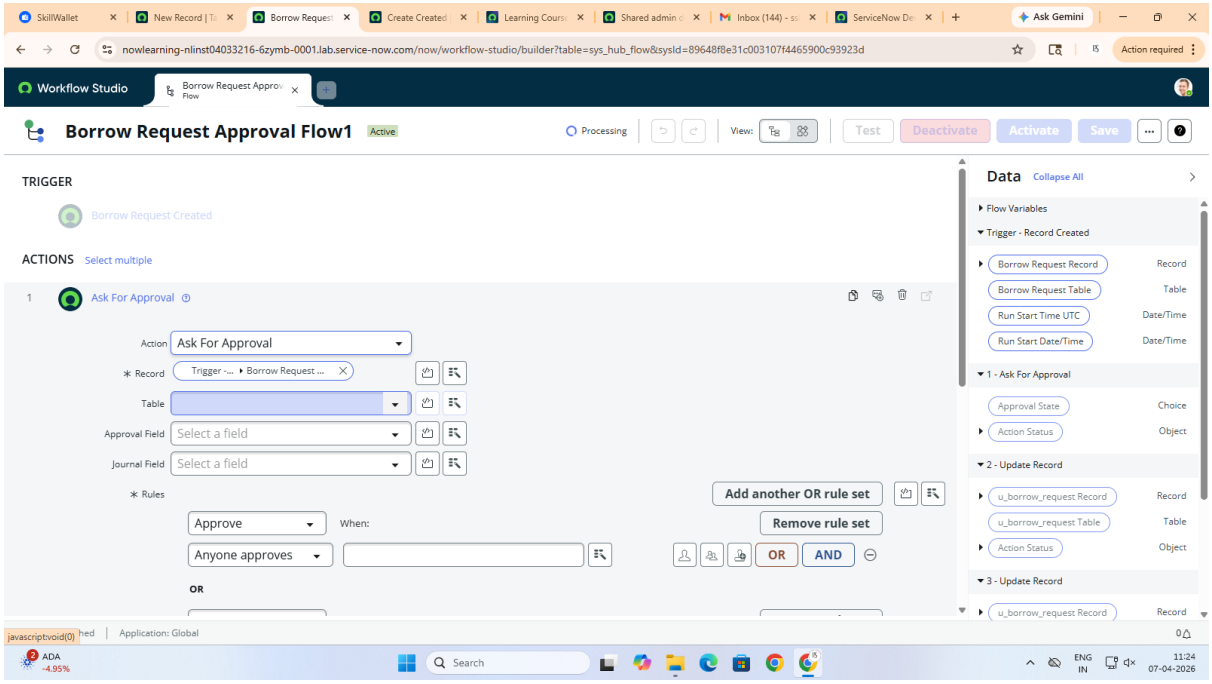
- Request sent to librarian
- Librarian approves/rejects

3. Request Tracking

- Users can check request status (Pending/Approved/Rejected)

4. Notification System

- Email/SMS alerts for status updates



6. Results

The system produced the following outcomes:

- **Efficiency:** Request processing time reduced significantly
- **Transparency:** Users can track request status
- **Automation:** Eliminates manual work
- **Centralization:** All requests stored in one system

7. Conclusion

The **Smart Library Request Workflow in ServiceNow** successfully automates the traditional library request system. It improves efficiency, reduces manual errors, and enhances user experience.

This system is ideal for colleges and institutions aiming to modernize their library services using workflow automation.
